### Chicago Clamp Company Introduces New Suspension Clamp System

Chicago Clamp Company has introduced their Suspension Clamp System for hanging equipment and suspending loads from joists. According to company sources, the patent-pending Suspension Clamp System is ideal

for hanging support rods, suspending HVAC equipment, piping conveyors and almost any equipment up to 2000 pounds. The Suspension Clamp System allows lateral adjustment and requires no welding or specialized tools.

End suspension clamps anchor the ends of back-to-back angles or channels to joists. Sources say these back-to-back angles or channels provide the benefit of symmetry by exerting an equal but opposite horizontal force on each other, thus canceling out the horizontal force. This contributes to less bending stress, so the angles or channels can support a higher concentrated load.
